SHERVIN BABAEI

Full-Stack Developer

Vancouver, BC | (604) 499-5673 | shervinb22@gmail.com | GitHub | Linkedin | Portfolio

SUMMARY

Full-stack developer building AI-integrated tooling and local LLM infrastructure. MERN/TypeScript across deployed production projects. Hack The Break 2026 Top-6 Finalist out of 36 teams.

EDUCATION

British Columbia Institute of Technology (BCIT) – GPA: 88% **Expected May 2027**
Diploma in Full-Stack Web Development
Relevant Coursework: OOP, Database Systems, Agile Development, UX/UI Design, Web Application Development

SKILLS

Languages: JavaScript (ES6+), TypeScript, Python, SQL
Frameworks & Libraries: React, Flask, TanStack, Node.js, Express.js, TailwindCSS
Databases & Caching: MySQL, PostgreSQL, MongoDB, Redis, Drizzle ORM, Sequelize, SQLAlchemy
Cloud & DevOps: AWS (EC2, S3), Docker, Vercel, GitHub Actions, Git, Jira, Figma, pytest, Jest
Auth & APIs: REST APIs, WebSockets, JWT, OAuth 2.0, Better Auth

PROJECTS

SkillMatch - Full-Stack Marketplace | Live App | Team Repo | My Repo **April 2026**
MongoDB, Express.js, React, Node.js, JWT, Vercel, shadCN
Role: Backend & DevOps Lead (3-person team)

- Shipped automated Vercel deployments on every merge by configuring GitHub Actions CI/CD pipelines, eliminating manual release overhead across a 3-person team.
- Enforced secure permission separation between instructors and students by implementing RBAC via JWT and linking registration limits to MongoDB transaction hooks, preventing unauthorized cross-role data access.
- Eliminated recurring build failures on Vercel by resolving ESM/CommonJS module conflicts through refactoring legacy dependencies to native Node.js modules.

GitScribe - Hack The Break 2026 (Top 6 / 36 Teams) | Live Demo **March 2026**
React, TypeScript, Auth0, LLM Integration
Role: UI/UX Lead & Core Developer (4-person team)

- Achieved a 92 Lighthouse performance score by translating Figma designs into a lazy-loaded React/TypeScript dashboard with optimized component architecture.
- Reduced user authentication steps by 50% by bypassing Auth0 SDK version conflicts with a custom GitHub OAuth SSO flow.
- Delivered a full AI commit message feature within a 24-hour sprint by architecting a real-time LLM pipeline from GitHub diff output to structured commit message UI, contributing to a Top-6 finish out of 36 teams.

Discord AI Automation Bridge **March 2026 - April 2026**
Python, Discord.py, LM Studio, REST API, asyncio

- Enabled real-time AI conversations on a live Discord server by integrating a local Qwen 3.5 9B model via the LM Studio API through a custom !ask command.
- Preserved bot responsiveness under concurrent load by offloading LLM inference to background threads via asyncio.to_thread(), eliminating main event loop blocking.
- Maintained bot uptime during LLM server failures by building layered exception handling across connection, API, and HTTP failure paths with user-facing error responses.

ThinkBoard - Full-Stack Notes Application **March 2026 - April 2026**
MongoDB, Express, React, Node.js, Redis (Upstash), Tailwind CSS

- Guaranteed data integrity at the persistence layer by centralizing request validation across Express middleware and Mongoose schemas, preventing malformed submissions from reaching the database.
- Protected the API from abuse by integrating Upstash Redis rate-limiting with a sliding window algorithm, capping throughput at 50 requests per 60 seconds and returning graceful 429 responses on breach.
- Removed ambiguous UI state by synchronizing frontend and backend validation with real-time toast notifications, ensuring users receive accurate feedback on every CRUD operation without a page refresh.
